Patent referred to, may be obtained by an inspection of Figure 72. This patent has to do with improvements in self-starting devices, by the introduction of certain combinations of inductance and condensance, or of resistance and reactance in parallel with the motor across the mains. Alexander Heyland6 has devised a form of single-phase selfstarting motor. In this machine the chief winding is distributed in a set of slots, the leakage self-induction being reduced by having separate teeth over a considerable part of the periphery. The starting winding consists of closed coils wound in a bunched fashion so as to increase the leakage self-induction. Elec. Eng., Sept., 1897. A thin section of iron also bridges the slots holding these conductors. The currents induced in this closed winding, laggreatly and produce a cross field similar to another phase winding. His more recent work7 on the polyphase motor may have also some bearing upon single-phase, work. Another interesting type of single-phase motor designed a short...
